The Roles of Policy, Labor, and Perception of Opioid Misuse Risk on Opioid Demand

Jaepil Lee

Carnegie Mellon University

May 6, 2024

Motivation

- Opioid misuse: using opioids not as directed by a doctor.
  - People misuse opioids for analgesic effects and rewarding properties.
  - Opioid misuse increases the risk of Opioid Use Disorder and overdose deaths.
  - Using illegally obtained opioids is riskier than misusing prescribed opioids.
- Laws and policies on prescribing opioids have been imposed recently.
  - The purpose is to decrease opioid misuse and, thus, opioid overdose deaths.
  - Reason #1: Opioids are too commonly prescribed, facilitating misuse.
  - Reason #2: People are over-confident about opioid misuse risk.

Motivation

- Opioid misuse: using opioids not as directed by a doctor.
  - People misuse opioids for analgesic effects and rewarding properties.
  - Opioid misuse increases the risk of Opioid Use Disorder and overdose deaths.
  - Using illegally obtained opioids is riskier than misusing prescribed opioids.
- Laws and policies on prescribing opioids have been imposed recently.
  - The purpose is to decrease opioid misuse and, thus, opioid overdose deaths.
  - Reason #1: Opioids are too commonly prescribed, facilitating misuse.
  - Reason #2: People are over-confident about opioid misuse risk.

Motivation

- Opioid misuse: using opioids not as directed by a doctor.
  - People misuse opioids for analgesic effects and rewarding properties.
  - Opioid misuse increases the risk of Opioid Use Disorder and overdose deaths.
  - Using illegally obtained opioids is riskier than misusing prescribed opioids.
- Laws and policies on prescribing opioids have been imposed recently.
  - The purpose is to decrease opioid misuse and, thus, opioid overdose deaths.
  - Reason #1: Opioids are too commonly prescribed, facilitating misuse.
  - Reason #2: People are over-confident about opioid misuse risk.

- Opioid misuse: using opioids not as directed by a doctor.
  - People misuse opioids for analgesic effects and rewarding properties.
  - Opioid misuse increases the risk of Opioid Use Disorder and overdose deaths.
  - Using illegally obtained opioids is riskier than misusing prescribed opioids.
- Laws and policies on prescribing opioids have been imposed recently.
  - The purpose is to decrease opioid misuse and, thus, opioid overdose deaths.
  - Reason #1: Opioids are too commonly prescribed, facilitating misuse.
  - Reason #2: People are over-confident about opioid misuse risk.

Motivation

- Opioid misuse: using opioids not as directed by a doctor.
  - People misuse opioids for analgesic effects and rewarding properties.
  - Opioid misuse increases the risk of Opioid Use Disorder and overdose deaths.
  - Using illegally obtained opioids is riskier than misusing prescribed opioids.
- Laws and policies on prescribing opioids have been imposed recently.
  - The purpose is to decrease opioid misuse and, thus, opioid overdose deaths.
  - Reason #1: Opioids are too commonly prescribed, facilitating misuse.
  - Reason #2: People are over-confident about opioid misuse risk.

Motivation

- Opioid misuse: using opioids not as directed by a doctor.
  - People misuse opioids for analgesic effects and rewarding properties.
  - Opioid misuse increases the risk of Opioid Use Disorder and overdose deaths.
  - Using illegally obtained opioids is riskier than misusing prescribed opioids.
- Laws and policies on prescribing opioids have been imposed recently.
  - The purpose is to decrease opioid misuse and, thus, opioid overdose deaths.
  - Reason #1: Opioids are too commonly prescribed, facilitating misuse.
  - Reason #2: People are over-confident about opioid misuse risk.

Motivation

- Opioid misuse: using opioids not as directed by a doctor.
  - People misuse opioids for analgesic effects and rewarding properties.
  - Opioid misuse increases the risk of Opioid Use Disorder and overdose deaths.
  - Using illegally obtained opioids is riskier than misusing prescribed opioids.
- Laws and policies on prescribing opioids have been imposed recently.
  - The purpose is to decrease opioid misuse and, thus, opioid overdose deaths.
  - Reason #1: Opioids are too commonly prescribed, facilitating misuse.
  - Reason #2: People are over-confident about opioid misuse risk.

Motivation

- These policies increased overdose deaths, but decreased opioid misuse.
- Overdose deaths were increasing due to illegal opioids.
- Opioid misuse was decreasing in all types of misuse.

Figure: Opioid Misuse by Rates Type

Research Question

- Who are the winners and losers of state-level policies on prescribing opioids?
  - How strong is the substitution effect toward illegal opioids?
  - Is there heterogeneity in substitution patterns across socioeconomic factors?
  - How much does the perception of opioid misuse risk play a role?
- What counterfactual policies can decrease both opioid misuse and death?
- This paper highlights:
  - The interaction of opioid misuse and labor for heterogeneous policy responses.
  - How the perception of opioid misuse risk amplifies the policies' effects.

Research Question

- This paper highlights:
  - The interaction of opioid misuse and labor for heterogeneous policy responses.
  - How the perception of opioid misuse risk amplifies the policies' effects.

What I do in this paper

- Show novel data facts on opioid misuse and the perception of its risk.
- Develop a dynamic of work and opioid misuse with perception bias:
  - To quantify the heterogeneous substitution toward illegal opioids by policies.
  - To measure the magnitude of the perception bias on opioid misuse.
- Predict counterfactual policies' effect on opioid misuse and deaths
  - Illegal opioids market: increase prices for illegally traded opioids
  - Labor market: increase unemployment benefits
  - Campaign: increase the perception of opioid misuse risk

What I do in this paper

- Show novel data facts on opioid misuse and the perception of its risk.

Contribution

- This paper evaluates the heterogeneous effect of health policies via labor.
  - Labor market: Schnell and Currie [2018], Mukherjee et al. [2023], Beheshti [2022], Park and Powell [2021], Dow et al. [2020]
  - Health policies: Kim [2021], Schnell [2022], Balestra et al. [2023], Sacks et al. [2021], Beheshti [2022], Mallatt [2022], Alpert et al. [2018]
- This paper provides a novel framework of dynamic demand on experience goods under conditionally homogeneous beliefs.
  - Rational: Greenwood et al. [2022], Hai and Heckman [2022], Arcidiacono et al. [2007]
  - Behavioral: O'Donoghue and Rabin [2015], Fang and Wang [2015]
- This paper extends CCP estimation with finite dependence to dynamic discrete choice models with conditionally homogeneous beliefs.
  - Finite dependence: Arcidiacono and Miller [2019], Arcidiacono and Miller [2020]
  - DDC with unobserved heterogeneity: Arcidiacono and Miller [2011], Hu and Xin [2023], Hwang [2021], Hu and Shum [2012]

Contribution

Policy Background

- Laws on prescribing opioids:
  - Set a maximum number of days, amount, etc.
  - Are aggregated to represent stringency for all prescriptions on adults.
  - 2015: 5 states, 2019: 39 states including D.C.
- Must-Access Prescription Drug Monitoring Program (MA-PDMP)
  - Requires doctors to check patient's prescription history.
  - Decreases prescription on the extensive margin. (Sacks et al. [2021])
  - 2015: 16 states, 2019: 34 states including D.C.
- In this paper, policies affect prescription rates on the extensive margin.

- Taking stock: Opioid misuse is intertwined with labor, perception of opioid misuse risk, and policy

Dynamic Model of Work and Opioid Use

Overview

- A representative individual lives in state g with education e.
- Life begins at age $a = 23$ and faces a risk of dying every period.
- Once he reaches 65, he stops aging and solves an infinite-horizon problem until he dies.

Figure: State Realization and Decision in Each Period

$$\Omega_g = (g, r_{g,t}, p_t^{rx}, p_{g,t}^{il})$$

$$\Omega_a = (e, a, exp, s, cw, bh, rx, \pi, \varepsilon)$$

State Space

Dynamic Model of Work and Opioid Use

Overview

- In each period, the individual observes his state's policies on prescribing opioids $r_{g,t}$ and opioid prices $p_t^{rx}, p_{g,t}^{il}$.
- He observes his work experience exp and opioid use disorder s.

Figure: State Realization and Decision in Each Period

$$\Omega_g = (g, r_{g,t}, p_t^{rx}, p_{g,t}^{il})$$

$$\Omega_a = (e, a, exp, s, cw, bh, rx, \pi, \varepsilon)$$

State Space

Dynamic Model of Work and Opioid Use

Overview

- In each period, the individual observes his state's policies on prescribing opioids $r_{g,t}$ and opioid prices $p_t^{rx}, p_{g,t}^{il}$.
- He observes his work experience exp and opioid use disorder s.

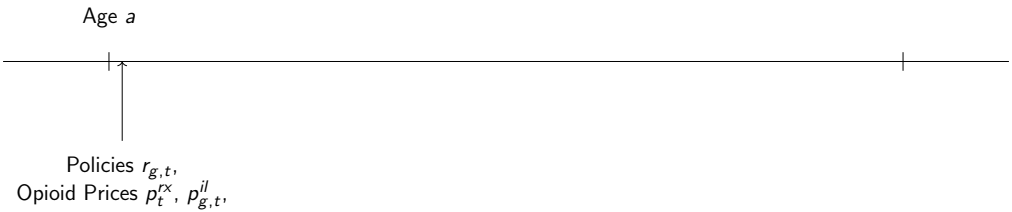

Figure: State Realization and Decision in Each Period

$$\Omega_g = (g, r_{g,t}, p_t^{rx}, p_{g,t}^{il})$$

$$\Omega_a = (e, a, exp, s, cw, bh, rx, \pi, \varepsilon)$$

State Space

Dynamic Model of Work and Opioid Use

$$\Omega_g = (g, r_{g,t}, p_t^{rx}, p_{g,t}^{il})$$

$$\Omega_a = (e, a, exp, s, cw, bh, rx, \pi, \varepsilon)$$

State Space

Dynamic Model of Work and Opioid Use

Overview

- The perception of opioid misuse risk π is realized conditional on his state.
- $\pi \in \{H, L\}$, H: high opioid misuse risk, L: Low risk opioid misuse risk

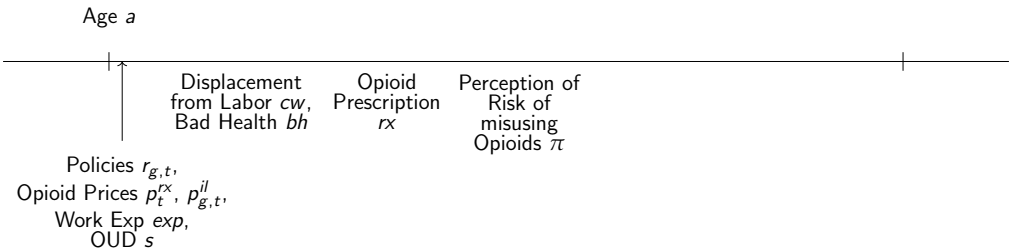

Figure: State Realization and Decision in Each Period

$$\Omega_g = (g, r_{g,t}, p_t^{rx}, p_{g,t}^{il})$$

$$\Omega_a = (e, a, exp, s, cw, bh, rx, \pi, \varepsilon)$$

Dynamic Model of Work and Opioid Use

Overview

- A vector of idiosyncratic shocks for choices ε is realized.
- The individual decides on working d_w, misusing prescribed opioids d_o^{rx}, and using illegally traded opioids d_o^{il}.

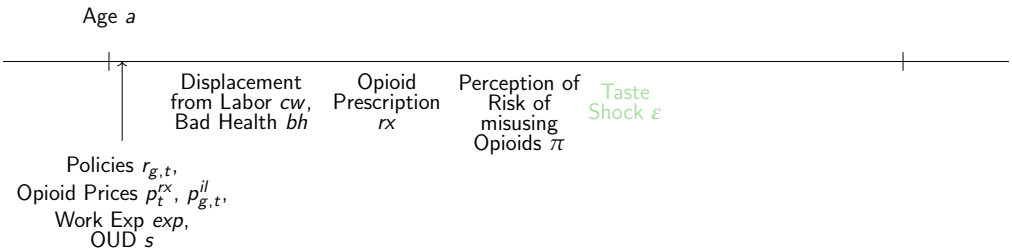

Figure: State Realization and Decision in Each Period

$$\Omega_g = (g, r_{g,t}, p_t^{rx}, p_{g,t}^{il})$$

$$\Omega_a = (e, a, exp, s, cw, bh, rx, \pi, \varepsilon)$$

State Space

Dynamic Model of Work and Opioid Use

Overview

- Opioid use disorder s' for the next period is realized conditional on opioid prescription and opioid misuse.
- Death is realized conditional on his state and opioid misuse.

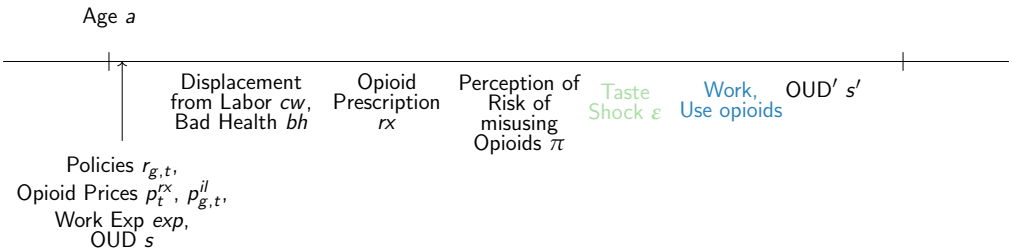

Figure: State Realization and Decision in Each Period

$$\Omega_g = (g, r_{g,t}, p_t^{rx}, p_{g,t}^{il})$$

$$\Omega_a = (e, a, exp, s, cw, bh, rx, \pi, \varepsilon)$$

State Space

Dynamic Model of Work and Opioid Use

Overview

- If he survives, he ages a year.
- From 60, people can be retired from work.
  - He is retired next period if he does not work or is displaced from labor.
  - Once retired, he expects he will never return to work.

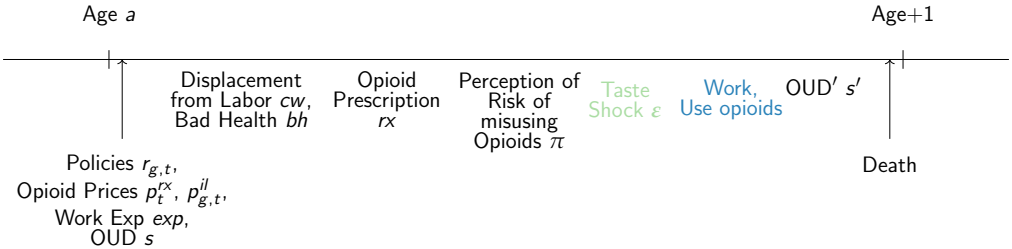

Figure: State Realization and Decision in Each Period

$$\Omega_g = (g, r_{g,t}, p_t^{rx}, p_{g,t}^{il})$$

$$\Omega_a = (e, a, exp, s, cw, bh, rx, \pi, \varepsilon)$$

Dynamic Model of Work and Opioid Use

Choice Set

- The individual can work and misuse opioids each period:

$$d_w = \mathbf{1}\{\text{work}\}$$
$$d_o^{rx} = \mathbf{1}\{\text{misuse prescribed opioids}\}$$
$$d_o^{il} = \mathbf{1}\{\text{use illegal opioids}\}$$

- The choice set is affected by i) displacement from labor *cw* and ii) being prescribed opioids *rx*.
  - If he is displaced from labor, then he cannot work in this period.
  - He can misuse prescribed opioids only if he is prescribed opioids.
  - If prescribed opioids, he must misuse them before using illegal opioids.
  - Using illegal opioids is always an option.

Formal Table

  - If prescribed opioids, he must misuse them before using illegal opioids.
  - Using illegal opioids is always an option.

Formal Table

Dynamic Model of Work and Opioid Use

Per-period Utility

- Denote x_a the set of individual state variables except s and π.

$$u_j(x_a, s, \pi, \Omega_g, \varepsilon; \boldsymbol{\theta}^y, \boldsymbol{\theta}^w, \boldsymbol{\theta}^o) =$$
$$\underbrace{\bar{y}(x_a; \boldsymbol{\theta}^y)}_{\text{Baseline Income}} + \underbrace{y(x_a, s, d_o^{rx}, d_o^{il}; \boldsymbol{\theta}^w) d_w}_{\text{Income from Working}} + \underbrace{u_o(x_a, \Omega_g, s, d_w, d_o^{rx}, d_o^{il}; \boldsymbol{\theta}^o)}_{\text{Utility from misusing opioids}} + \varepsilon_j.$$

- Baseline income approximates lifetime earnings.
- Income from work reflects productivity loss from OUD and opioid misuse.
- Utility from misusing opioids captures:
  - Compensating for the disutility of being displaced from labor
  - The disutility of not misusing opioids if one has Opioid Use Disorder
  - The complementarity of misusing opioids and not working

Details

Dynamic Model of Work and Opioid Use

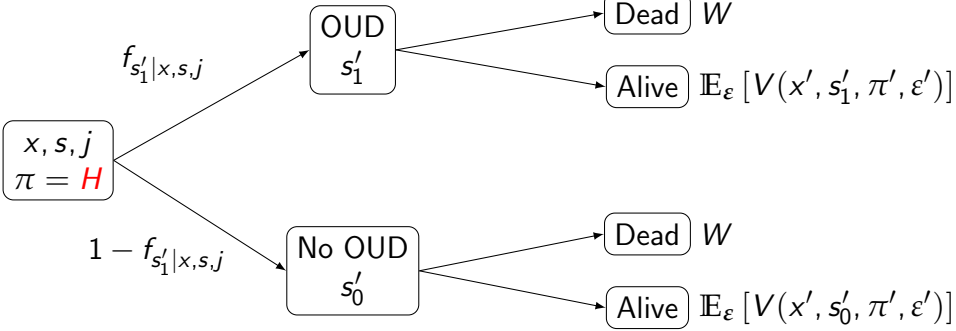
$$x_\pi = [\mathbf{1}_{cw'=1}, \mathbf{1}_{cw'=2}, \mathbf{1}_{cw'=3}, bh', rx', s']$$

Dynamic Model of Work and Opioid Use

Perception of the risk of misusing opioids

- The individual stochastically perceives the risk of misusing opioids, π.
  - High risk ($\pi = H$): expects the actual probability of getting OUD
  - Low risk ($\pi = L$): expects a lower probability of getting OUD by δ

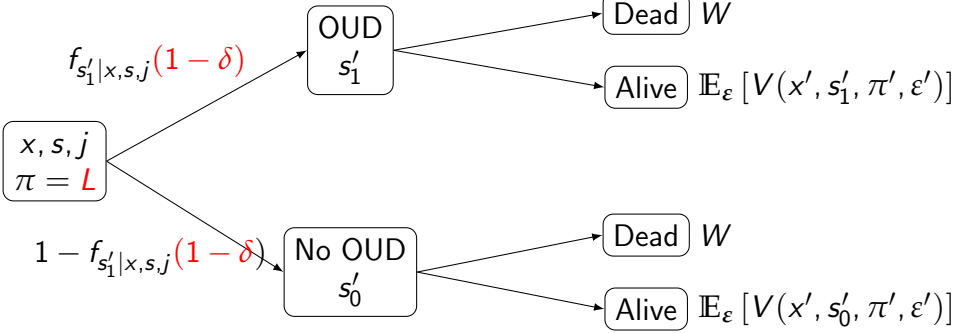


Details

Dynamic Model of Work and Opioid Use

Perception of the risk of misusing opioids

- The individual stochastically perceives the risk of misusing opioids, π.
  - High risk ($\pi = H$): expects the actual probability of getting OUD
  - Low risk ($\pi = L$): expects a lower probability of getting OUD by δ



Details

Dynamic Model of Work and Opioid Use

Value Function Representation

- The value function of a living individual $V(x, s, \pi, \boldsymbol{\varepsilon})$ is

$$V(x_a, s, \pi, \boldsymbol{\varepsilon}) = \max_{j \in \mathcal{J}(cw,rx)} u_j(x_a, s; \boldsymbol{\theta}^y, \boldsymbol{\theta}^o) + \varepsilon_j +$$

$$\beta \left[\begin{array}{r} (1-\pi\delta) f_{s_1'|x_a,s,j} \left(f_{d|x_a,s_1',j} W + (1 - f_{d|x_a,s_1',j}) \sum_{x_a',\pi'} \mathbb{E}_\varepsilon \left[V(x_a', s_1', \pi', \boldsymbol{\varepsilon}') \right] f_{x_a'|x_a,s_1',d_j} \right) \\ +[1-(1-\pi\delta) f_{s_1'|x_a,s,j})] \left(f_{d|x_a,s_0',j} W + (1 - f_{d|x_a,s_0',j}) \sum_{x_a',\pi'} \mathbb{E}_\varepsilon \left[V(x_a', s_0', \pi', \boldsymbol{\varepsilon}') \right] f_{x_a'|x_a,s_0',d_j} \right) \end{array} \right]$$

- W: the (dis)utility upon death
- δ: the magnitude of discounting the probability of getting opioid use disorder
- The model is solved by contraction mapping at 65 and backward induction.

Alternative

Identification

The parameters to identify are:

- Initial type probability $\bar{q}(s|x_a)$
- Per-period utility
  - Income process θ^y, σ_y
  - Utility from misusing opioids θ^o
- Transition probabilities
  - Opioid Use Disorder θ^s
  - Death θ^d
  - Displacement from work and bad health θ^{ch}, α_g^{ch}
  - Prescription to opioids θ^{rx}, γ, α_g^{rx}
  - Perception of the risk of misusing opioids θ^{π}
- (Dis)utility of death W
- Perception bias δ
- Discount factor $\beta = 0.96$
- Distribution of ε: T1EV

  - Utility from misusing opioids $\boldsymbol{\theta}^o$
- Transition probabilities
  - Opioid Use Disorder $\boldsymbol{\theta}^s$
  - Death $\boldsymbol{\theta}^d$
  - Displacement from work and bad health $\boldsymbol{\theta}^{ch}$, α_g^{ch}
  - Prescription to opioids $\boldsymbol{\theta}^{rx}$, γ, α_g^{rx}
  - Perception of the risk of misusing opioids $\boldsymbol{\theta}^{\pi}$
- (Dis)utility of death W
- Perception bias δ
- Discount factor $\beta = 0.96$
- Distribution of $\boldsymbol{\varepsilon}$: T1EV

Identification

First stage

If $\bar{q}(s|x_a)$ is known, the parameters and CCPs below are identifiable:

- Perception of the risk of misusing opioids $\boldsymbol{\theta}^{\pi}$
- Unrestricted CCPs $P_j(x_a, s, \pi)$
- The income process $\boldsymbol{\theta}^{y}$, σ_y
- Transition to Opioid Use Disorder $\boldsymbol{\theta}^{s}$

Then, the transition parameters below are identifiable

- Death $\boldsymbol{\theta}^{d}$
- Displacement from labor and bad health $\boldsymbol{\theta}^{ch}$, α_g^{ch}
- Prescription to opioids $\boldsymbol{\theta}^{rx}$, γ, α_g^{rx}

Challenge

Identification

Challenge

- s is not observed; use four proxies to identify $\bar{q}(s|x_a)$
  - $\pi_1^* \in \{0,1\}$: "great risk" of using marijuana
  - $\pi_2^* \in \{0,1\}$: "great risk" of using cocaine
  - $\pi_3^* \in \{0,1\}$: "great risk" of using LSD
  - $ev \in \{0,1\}$: "Ever misused opioids in the past"
- NSDUH '15-'19 missing s' if $d_o^{rx} = d_o^{il} = 0$:
  - Use NSDUH '21 for $f_s(s'|rx = 1, d_o^{rx} = 0, d_o^{il} = 0)$
- Assumption on the proxy variables:
  - They have logistic probabilities conditional on (x_a, s).
  - They are independent conditional on (x_a, s).
- Then, $\bar{q}(s|x_a)$, f_{ev}, f_{π_1}, f_{π_2}, and f_{π_3} are identified. (Hwang [2021])

Transition

Identification

- NSDUH is an RCS: need auxiliary panel data for $\boldsymbol{\theta}^d$, $\boldsymbol{\theta}^{ch}$, $\boldsymbol{\theta}^{rx}$, γ, α_g^{ch}, α_g^{rx}
- NSDUH + NVSS, MEPS, and SIPP
  - NVSS: Death $\boldsymbol{\theta}^d$
  - SIPP: Constraint to work & bad health $\boldsymbol{\theta}^{ch}$
  - MEPS: Opioid Prescription $\boldsymbol{\theta}^{rx}$
  - NSDUH 2015-2019: Year-by-year distribution

Details Limited Feedback

Identification

Hotz-Miller Inversion and Finite Dependence

(Dis)utility of death W, Utility from misusing opioids θ^o, Perception bias δ

- Hotz-Miller inversion + finite dependence (Arcidiacono and Miller [2019])
- Challenge: δ is unknown and affects finite dependence paths.

Proposition

If there exists a 1-period finite dependence path (FD) for a subset of state transitions where the perception stayed "great risk" for two periods ($\pi = H, \pi' = H$), then a finite dependence path exists as known a function under the rank condition in Arcidiacono and Miller [2019].

(Dis)utility of death W, Utility from misusing opioids θ^o, Perception bias δ

- Hotz-Miller inversion + finite dependence (Arcidiacono and Miller [2019])
- Challenge: δ is unknown and affects finite dependence paths.

Proposition

If there exists a 1-period finite dependence path (FD) for a subset of state transitions where the perception stayed "great risk" for two periods $(\pi = H, \pi' = H)$*, then a finite dependence path exists as known a function under the rank condition in Arcidiacono and Miller [2019].*

Details

Identification

- $\boldsymbol{\theta}^o, W, \delta$ identified from a set of conditional value function (CVF) differences with finite dependence, given all other parameters for transition probabilities and CCPs ▸ HM-Inversion-FD
- The variations for identification are:
  - $\boldsymbol{\theta}^o$: CVF differences at (x, s) between opioid misuse
  - W: Differences-in-CVF differences between opioid misuse across ages
  - δ: Differences-in-CVF differences between opioid misuse across different π's

Identification

- $\boldsymbol{\theta}^o, W, \delta$ identified from a set of conditional value function (CVF) differences with finite dependence, given all other parameters for transition probabilities and CCPs ▸ HM-Inversion-FD
- The variations for identification are:
  - $\boldsymbol{\theta}^o$: CVF differences at (x, s) between opioid misuse
  - W: Differences-in-CVF differences between opioid misuse across ages
  - δ: Differences-in-CVF differences between opioid misuse across different π's

Estimation

A modified 'two-step' CCP estimation (Arcidiacono and Miller 2011, 2019):

Stage 1: Estimate CCPs and the transition probabilities.

1. EM algorithm: θ^u, $P_j(x, s, \pi)$, θ^π, θ^y, θ^s Details
2. Indirect inference: θ^d, θ^{ch}, θ^{rx} given the EM algorithm estimates Details

Stage 2: Estimate θ^o, W, δ.

1. Choose a set of conditional value function differences. Details
2. Guess δ_0.
3. Find a finite dependence (FD) path for each conditional value difference:
   - 3.1 Baseline: (π_0, π_0'). Details
   - 3.2 Biased: $(\pi_0, \pi_1'), (\pi_1, \pi_0'), (\pi_1, \pi_1')$ with δ_0 given the baseline FD Details
4. Estimate θ^o, W, δ with MDE. Details
5. Update δ_0 with δ and go to 3 until convergence.

Estimation

A modified 'two-step' CCP estimation (Arcidiacono and Miller 2011, 2019):

Stage 1: Estimate CCPs and the transition probabilities.

1. EM algorithm: θ^u, $P_j(x, s, \pi)$, θ^π, θ^y, θ^s Details
2. Indirect inference: θ^d, θ^{ch}, θ^{rx} given the EM algorithm estimates Details

Stage 2: Estimate θ^o, W, δ.

1. Choose a set of conditional value function differences. Details
2. Guess δ_0.
3. Find a finite dependence (FD) path for each conditional value difference:
   - 3.1 Baseline: (π_0, π_0'). Details
   - 3.2 Biased: $(\pi_0, \pi_1'), (\pi_1, \pi_0'), (\pi_1, \pi_1')$ with δ_0 given the baseline FD Details
4. Estimate θ^o, W, δ with MDE. Details
5. Update δ_0 with δ and go to 3 until convergence.

Estimation

A modified 'two-step' CCP estimation (Arcidiacono and Miller 2011, 2019):

Stage 1: Estimate CCPs and the transition probabilities.

1. EM algorithm: $\boldsymbol{\theta}^u$, $P_j(x, s, \pi)$, $\boldsymbol{\theta}^\pi$, $\boldsymbol{\theta}^y$, $\boldsymbol{\theta}^s$ Details
2. Indirect inference: $\boldsymbol{\theta}^d$, $\boldsymbol{\theta}^{ch}$, $\boldsymbol{\theta}^{rx}$ given the EM algorithm estimates Details

Stage 2: Estimate $\boldsymbol{\theta}^o$, W, δ.

1. Choose a set of conditional value function differences. Details
2. Guess δ_0.
3. Find a finite dependence (FD) path for each conditional value difference:
   - 3.1 Baseline: (π_0, π_0'). Details
   - 3.2 Biased: $(\pi_0, \pi_1'), (\pi_1, \pi_0'), (\pi_1, \pi_1')$ with δ_0 given the baseline FD Details
4. Estimate $\boldsymbol{\theta}^o$, W, δ with MDE. Details
5. Update δ_0 with δ and go to 3 until convergence.

Estimation

A modified 'two-step' CCP estimation (Arcidiacono and Miller 2011, 2019):

Stage 1: Estimate CCPs and the transition probabilities.

5. Update δ_0 with δ and go to 3 until convergence.

Estimation

- Current version uses $a = 25, 45, 65$ with 3 states g. $\approx$30,000 moments.
- Initial guess on $\delta = 0.15$.
- Transition probabilities are sensitive to the targeted marginal transition probabilities.
- The second stage is computationally heavy.

Estimation

- The first stage estimates with smaller covariates:
  - Show reasonable signs and magnitudes on income, but not for being prescribed opioids.
  - The estimated s.d. of the measurement error on income is large.
- Calibration exercises with plausible transitions in the second stage show:
  - The coefficients for the disutility of death and opioid misuse are noisy, but Opioid Use Disorder is sensible.
  - Increase in the prescription rates does not necessarily increase future opioid misuse, but this is sensitive to the rate of getting Opioid Use Disorder θ_s.

Estimation

- The first stage estimates with smaller covariates:
  - Show reasonable signs and magnitudes on income, but not for being prescribed opioids.
  - The estimated s.d. of the measurement error on income is large.
- Calibration exercises with plausible transitions in the second stage show:
  - The coefficients for the disutility of death and opioid misuse are noisy, but Opioid Use Disorder is sensible.
  - Increase in the prescription rates does not necessarily increase future opioid misuse, but this is sensitive to the rate of getting Opioid Use Disorder θ_s.

Conclusion

- This paper evaluates policy interventions on opioid prescribing.
  - Develops a dynamic model to quantify the substitution toward illegal opioids.
  - Focuses on opioid misuse and labor for policy's heterogeneous effect.
  - Highlights the role of the perception of opioid misuse risk.
- Model validation: compare with reduced-form results in the literature.
- Predict responses to counterfactual policies.
  - Stricter policies? Higher illegal (or prescription) opioid prices?
  - Unemployment benefits: what about people with Opioid Use Disorder?
  - Raise the probability of perceiving high opioid misuse risk?

Conclusion

- This paper evaluates policy interventions on opioid prescribing.
  - Develops a dynamic model to quantify the substitution toward illegal opioids.
  - Focuses on opioid misuse and labor for policy's heterogeneous effect.
  - Highlights the role of the perception of opioid misuse risk.
- Model validation: compare with reduced-form results in the literature.
- Predict responses to counterfactual policies.
  - Stricter policies? Higher illegal (or prescription) opioid prices?
  - Unemployment benefits: what about people with Opioid Use Disorder?
  - Raise the probability of perceiving high opioid misuse risk?

Conclusion

"When you add hopelessness, unemployment, and lack of education on top of all that, it's kind of a recipe for disaster."

- Jan Rader, Huntington Fire Department Chief, *Heroin(e)*

Identification

- Suppose we have a FD path by only using tomorrow's state where $\pi = 0$:

$$\kappa(x_a'', s'', \pi_0 | x_a, s, \pi_0, i; \pi_0') = \kappa(x_a'', s'', \pi_0 | x_a, s, \pi_0, j; \pi_0')$$

- Then, the FD path by only using tomorrow's state where $\pi' = 1$ is:

$$\omega(x_a', s', \pi_1' | x_a, s, \pi_0, i) = g\begin{pmatrix} \delta, \kappa(x_a'', s'', \pi_0'' | x_a, s, \pi_0, i; \pi_0'), \\ f(s_1 | x, s, \pi_0)), f(x_a', s', \pi_1' | x_a, s, \pi_0, i) \end{pmatrix}$$

$$\omega(x_a', s', \pi_1' | x_a, s, \pi_0, j) = g\begin{pmatrix} \delta, \kappa(x_a'', s'', \pi_0'' | x_a, s, \pi_0, j; \pi_0'), \\ f(s_1 | x, s, \pi_0)), f(x_a', s', \pi_1' | x_a, s, \pi_0, j) \end{pmatrix}$$

Col Back

State-level Restrictions and Rx Opioids

- I use aggregate data to proxy for opioid Rx rate ($y_{i,t}$):
  - Rx/100: Opioid Rx per 100 population in state g in year t
  - MME[1]: The amount of opioids dispensed in state g in year-**quarter** t
- Two-way fixed effects (TWFE) regression with 2000-2019 data:

$$\log(y_{g,t}) = \beta_0 r_{g,t} + \sum_{k=1}^{3} \beta_j f\{cw = k\}_{g,t} + \beta_4 f\{bh\}_{g,t} + \alpha_g + \delta_t + \varepsilon_{g,t}$$

- The coefficient β are negative for both regressions.

Back

State-level Restrictions and Illegal Opioids

Prices for illegally traded opioids: 2014-2019

- Are street prices correlated with the state-level restrictions on prescription opioids?
- Average of the reported price per MME in state g and year t during 2013-2019

$$\bar{p}_{g,t} = \beta_0 r_{g,t} + \sum_{k=1}^{3} \beta_j f\{cw = k\}_{g,t} + \beta_4 f\{bh\}_{g,t} + \alpha_g + \delta_t + \varepsilon_{g,t}$$

- The coefficient β is statistically insignificant.

Back

State-level Restrictions and Mortality Rates

Mortality rates by types of opioid

- Mortality Rate = Number of Deaths / Population * 100,000
- Two-way fixed effect regression:

$$\text{Mortality Rate}_{g,t} = \beta_0 r_{g,t} + \sum_{k=1}^{3} \beta_j f\{cw = k\}_{g,t} + \beta_4 f\{bh\}_{g,t} + \alpha_g + \delta_t + \varepsilon_{g,t}$$

- The coefficients β are positive for synthetic opioids, negative for heroin, and (insignificant) positive for Rx opioids.

Back

Choice Set

- An individual can choose to work or misuse opioids each period:

$$d_w = \mathbf{1}\{\text{work}\}$$
$$d_o^{rx} = \mathbf{1}\{\text{misuse Rx opioids}\}$$
$$d_o^{il} = \mathbf{1}\{\text{use illegal opioids}\}$$

- An action is indexed by $j = 1 + d_o^{rx} + 2d_o^{il} + 4d_w$ and $d_j = \mathbf{1}\{\text{Chooses } j\}$.
- The choice set $\mathcal{J}(rx, k)$ is defined by i) being prescribed opioids rx and ii) displacement from labor market $k = \mathbf{1}\{cw \neq 0\}$:

$$\mathcal{J}(0,0) = \{1,3,5,7\}$$
$$\mathcal{J}(1,0) = \{1,2,4,5,6,8\}$$
$$\mathcal{J}(0,1) = \{1,3\}$$
$$\mathcal{J}(1,1) = \{1,2,4\}$$

Back Table State Space

Choice Set

- An individual can choose to work or misuse opioids each period:

$$d_w = \mathbf{1}\{\text{work}\}$$
$$d_o^{rx} = \mathbf{1}\{\text{misuse Rx opioids}\}$$
$$d_o^{il} = \mathbf{1}\{\text{use illegal opioids}\}$$

- Denote $\tilde{d}_j$ as a negation of action d_j.

&P_s(s'|x, \pi, \pi^*, ev, d_j) \\
&= \sum_s q(s|x, \pi, \pi^*, ev, d_j) f_s(s'|s, rx, d_o^{rx}, d_o^{il}; \boldsymbol{\theta}^s) \\
&= \sum_s \frac{P(d_j|s, x, \pi, \pi^*, ev)}{P(d_j|x, \pi, \pi^*, ev)} q(s|x, \pi, \pi^*, ev) f_s(s'|s, rx, d_o^{rx}, d_o^{il}; \boldsymbol{\theta}^s) \\
&= \sum_s \frac{P(d_j|s, x, \pi)}{P(d_j|x, \pi, \pi^*, ev)} \frac{P(\pi|x, s; \boldsymbol{\theta}^\pi) q(s|x, \pi^*, ev)}{P(\pi|x, \pi^*, ev)} f_s(s'|s, rx, d_o^{rx}, d_o^{il}; \boldsymbol{\theta}^s)
\end{aligned}
$$

Back

Identification: Unrestricted CCPs

$$P(d_j|x,\pi,\pi^*,ev) = \sum_s \frac{P(\pi|x,s;\boldsymbol{\theta}^\pi)q(s|x,\pi^*,ev)}{P(\pi|x,\pi^*,ev)} P(d_j|x,\pi,s)$$

- Let $iv = (\pi^*, ev)$ and suppose $iv \in \{0,1\}$. For a given (d_j, x, π, iv) and $q(s|x,iv)$:

$$\underbrace{\begin{bmatrix} q(s_1|x,iv_0) & 1-q(s_1|x,iv_0) \\ q(s_1|x,iv_1) & 1-q(s_1|x,iv_1) \end{bmatrix}}_{:=Q} \underbrace{\begin{bmatrix} P(d_j|x,s_1) \\ P(d_j|x,s_0) \end{bmatrix}}_{:=p_s} = \underbrace{\begin{bmatrix} P(d_j|x,iv_0) \\ P(d_j|x,iv_1) \end{bmatrix}}_{:=p_x}$$

- If $q(s_1|x,iv_0) \neq q(s_1|x,iv_1)$, then $det(Q) \neq 0$. Thus, $p_s = Q^{-1}p_x$.
- With more variation in iv, $q(s|x,iv)$ is over-identified.

Back

Probability of Dying

- The probability of dying increases wrt (d_o^{rx}, d_o^{il}):

$$f_d(s', a, d_{rx}, d_{il}; \theta^d) = \sum_{i \in D} f(dth_i | s', a, g, d_{rx}, d_{il}; \boldsymbol{\theta}_i^d)$$

where $D = \{ocd, rx, il, bth\}$

$$\begin{aligned}
f(dth_{ocd} | s', a, g, d_{rx}, d_{il}; \theta^{ocd}) &= \frac{\exp(x'_{ocd}\theta^d)}{1 + \exp(x'_{ocd}\theta^d)} \\
f(dth_{rx} | s', a, g, d_{rx}, d_{il}; \theta^{rx}) &= \theta^d_{rx} d_{rx} \\
f(dth_{il} | s', a, g, d_{rx}, d_{il}; \theta^{il}) &= \theta^d_{il} d_{il} \\
f(dth_{bth} | s', a, g, d_{rx}, d_{il}; \theta^{bth}) &= \theta^d_{bth} d_{rx} d_{il} \\
f(dth | s') &= \theta^d_s s'
\end{aligned}$$

\end{aligned}
$$

Identification Derivation Back

Estimation: Stage 2

- For a given $\boldsymbol{\omega}(x', s', x, s)$ where $\sum_{k \in \mathcal{J}(rx', k')} \omega_k(x', s', x, s) = 1$ and $|\omega_k(x', s', x, s)| < \infty$,

$$\bar{V}(x', s_0') = \sum_{k \in \mathcal{J}(rx', k')} \left(v_k(x', s_0') - \log P(d_k | x', s_0')\right) \omega_k(x', s_0', x, s)$$

$$\bar{V}(x', s_1') = \sum_{k \in \mathcal{J}(rx', k')} \left(v_k(x', s_1') - \log P(d_k | x', s_1')\right) \omega_k(x', s_1', x, s)$$

- Iterate $v_k(x', s')$ once more wrt utilities and future value functions
- Find the weights $\omega_k(x'', s_0'', x, s)$ that cancels out the two-period-ahead ex-ante value functions $\bar{V}(x'', s'')$
- Then, we have a moment for identifying $\boldsymbol{\theta}^o$.

Back Back

Estimation: Stage 3

- Suppose we have such weights for each $(x, s, j, 1)$.
- Then, estimating $\boldsymbol{\theta}^o, W, \delta$ becomes a GMM problem:

$$\begin{bmatrix} \log P(d_2|x_1, s_0) - \log P(d_1|x_1, s_0) \\ \vdots \\ \log P(d_J|x_1, s_0) - \log P(d_1|x_1, s_0) \\ \log P(d_2|x_1, s_1) - \log P(d_1|x_1, s_1) \\ \vdots \\ \log P(d_J|x_1, s_1) - \log P(d_1|x_1, s_1) \\ \vdots \\ \log P(d_2|x_M, s_1) - \log P(d_1|x_M, s_1) \\ \vdots \\ \log P(d_J|x_M, s_1) - \log P(d_1|x_M, s_1) \end{bmatrix} = \begin{bmatrix} v_2(x_1, s_0) - v_1(x_1, s_0) \\ \vdots \\ v_J(x_1, s_0) - v_1(x_1, s_0) \\ v_2(x_1, s_1) - v_1(x_1, s_1) \\ \vdots \\ v_J(x_1, s_1) - v_1(x_1, s_1) \\ \vdots \\ v_2(x_M, s_1) - v_1(x_M, s_1) \\ \vdots \\ v_J(x_M, s_1) - v_1(x_M, s_1) \end{bmatrix}$$
